THE COLLEGE OF HIGHER LEARNING.

Langara.

THE COLLEGE OF HIGHER LEARNING.

Proposed Project 1: Everything for Moving

Pain Point:

Moving is honestly one of the most stressful things people go through. There are so many little tasks scattered all over the place: finding movers, buying boxes, selling or donating old furniture, cleaning, setting up utilities, and the list goes on. Right now, people usually need to use different apps and services for each of these steps, and that just makes the process more frustrating and overwhelming.

User Motivation:

People would use this app because it brings everything together in one place. Instead of stressing out over five different platforms and phone calls, they can manage their entire move through a single app. That saves time, reduces stress, and gives them peace of mind knowing that their move is organized from start to finish.

Project Features

1. Moving Services Marketplace

Users can browse and book movers (independent movers or companies) directly through the app. They'll be able to compare prices, reviews, and availability before making a choice. Real-time truck tracking gives them peace of mind, just like ride-sharing apps. It's convenient, transparent, and something people would definitely be willing to pay for.

2. Furniture Selling & Donation Hub

The app also makes it easy to sell or donate items you don't want to take with you. You can upload photos, set a price, or choose to donate to local charities that even offer free pick-up. This saves time, helps declutter, and could also generate some extra cash. Users might pay extra for boosted listings or faster sales.

3. Extra Home Setup Services

Moving isn't just about transporting stuff, it's also about getting your new place ready. Through the app, users can book add-on services like cleaning, recycling pick-up, or utility setup (internet, electricity, gas). Having all of these in one app makes the whole process smoother and way less stressful.

Data Driven Component

How will you use data in your project?

The app will collect data from both users (like moving dates, budgets, and listings) and service providers (mover availability, pricing, reviews). This data will be used to give smart recommendations, show real-time tracking, and make the decision-making process easier.

What is the data set you will be visualizing?

Mover availability, costs, and reviews; active vs sold/donated furniture listings; and how the budget is being allocated for moving.

Can the data change via user interaction?

Yes, totally. Users can change their budgets, update bookings, or add/remove listings, and the data will update instantly on the app.

Where is it from?

Part of the data is from users (their move details, budget, and listings), and part is from partnered vendors and movers (pricing, availability, reviews).

In what way will the user interact with the data visualizations?

They'll be able to compare movers side by side, see charts of their budget, and track their moving truck live on a map. Any changes they make update in real time so they can adjust their choices.

Why is this relevant to the user?

Moving is stressful because there are too many decisions to make at once. Visualized data helps users quickly understand costs, timelines, and progress without feeling overwhelmed. It turns complex tasks into simple, clear steps.

What is the data source?

User input: moving details, budgets, listings. Vendor/mover data: pricing, schedules, reviews (initially fake, later real with partnerships)

Major Feature

Feature 1: Moving services marketplace

- Why is this feature important to the user and application?

It connects people to reliable movers in one place, instead of wasting time on multiple websites. It's also the app's core functionality.

- What problem is being solved?

And how will the user interact with this feature? Booking movers can be messy—unclear prices, availability issues, and reviews you can't trust. Here, users can compare, book, and track in real time, just like Uber but for moving.

- Why is this relevant to the project?

Moving help is the central pain point of relocation. Without this feature, the app would lose its main purpose. It ensures that the platform isn't just about planning or organizing, but actually delivers the core service users need the most getting their belongings from one place to another in a secure and transparent way.

Feature 2: Furniture selling & donation hub

- Why is this feature important to the user and application?

People don't want to take everything with them when they move. This hub makes it easy to sell or donate items in the same place they're booking movers.

- What problem is being solved?

And how will the user interact with this feature? The problem is that selling furniture usually requires separate apps or marketplaces, while donating requires calling charities and arranging pick-ups. This is time-consuming during an already stressful move. With this feature, users can

upload photos of their items, set a price, or mark them for donation. They can also connect directly with buyers or charities who offer pick-up services.

- Why is this relevant to the project?

Moving isn't just about transporting items, it's also about deciding what to keep and what to leave behind. By including this feature, the app addresses a major part of the moving process that is usually overlooked. It makes the platform more holistic and increases the chances users will rely on it for their entire moving journey.

Feature 3: Extra home setup services

- Why is this feature important to the user and application?

Delivering boxes isn't the end people still need to clean and set up utilities. This saves them time and extra stress.

- What problem is being solved?

And how will the user interact with this feature? Normally you'd have to call several providers for cleaning, trash, or utilities. Here, it's all bookable inside the app.

- Why is this relevant to the project?

It shows the app covers the *entire* moving journey, not just transportation. It's what makes the app stand out as an all-in-one solution.

Proposed Project 2: BabyHub

Industry: E MedTech / Parenting Tech

Pain point: Parents struggle to organize appointments, supplies, and expenses while caring for a baby. Multiple apps or paper notes create stress and disorganization.

Project Features

1. Smart Organizer: Tracks doctor visits, vaccinations, and other appointments, sending reminders to ensure parents never miss an important event.
2. Supply Tracker: Manages essentials like diapers, formula, and clothes. Sends low-stock alerts and generates shopping lists, helping parents stay prepared.
3. Budget Tracker: Logs baby-related expenses and provides charts for spending trends. Helps parents manage monthly budgets and avoid overspending.

Parents may pay for premium features like cloud sync, advanced analytics, or custom reminders.

Data Driven Component

- How will you use data in your project?

Data will be used to track appointments, supply levels, and expenses, generating charts and progress bars for easy insights.

- What is the data set you will be visualizing?

Monthly spending by category, supply stock levels, and upcoming appointments.

- Can the data change via user interaction?

Yes, parents can add, edit, or remove expenses, supplies, and appointments.

- Where is it from?

All the data is user-generated. Parents input their baby's supplies, appointments, and expenses. This makes the data personalized and accurate.

- In what way will the user interact with the data visualizations?

Parents can view charts and progress bars, click calendar events to edit, and filter data by category or date.

- Why is this relevant to the user?

Visualizations help parents quickly understand trends, identify gaps, and make informed decisions.

- What is the data source? real/fake/input etc.

The data is real and comes from user input. Parents log what matters to them. This ensures the app stays personal and useful.

Major Feature: Smart Organizer

- Why is this feature important to the user and application?

Smart Organizer prevents missed appointments, reduces stress, and keeps parents organized.

- What problem is being solved?

Parents often forget critical appointments due to stress and busy schedules. This can affect their baby's health. BabyHub prevents that problem.

How is it being solved?

- Centralized calendar with automated reminders and event categorization.

In what way will the user interact with this feature?

Add, edit, delete events, mark reminders as done, view weekly or monthly schedules.

- Why is this relevant to the user?

Ensures timely baby care and helps parents manage daily schedules efficiently.

Feature 1: Supply Tracker

- Why is this feature important to the user and application?

Supply Tracker ensures parents do not run out of essential items, preventing emergencies and stress.

- What problem is being solved? And how will the user interact with this feature?

Last-minute shortages of diapers, formula, clothes, or medicines. Interaction: Parents log supplies, set low-stock alerts, and view stock via progress bars.

- Why is this relevant to the project?

Saves time, ensures preparedness, and reduces parental stress.

Feature 2: Budget Tracker

- Why is this feature important to the user and application?

Budget Tracker helps parents manage baby-related expenses, preventing overspending and improving financial planning.

- What problem is being solved? And how will the user interact with this feature?

Many parents lose track of expenses and go over budget. With this feature, they log expenses, categorize them, and view charts. It makes budgeting simple.

- Why is this relevant to the project?

Baby care is expensive and unpredictable. Budget tracking helps families prepare better. It adds real value to the app.

Proposed Project 3: Vancouver Fashion Finder

Industry: Retail / Lifestyle Tech

Pain Point: Fashion lovers in Vancouver often struggle to discover stores that fit their personal style. While malls exist, many unique local shops, vintage stores, sustainable brands, and pop-up markets remain hard to find. People spend too much time searching online or miss hidden gems and local events altogether.

User Motivation: Users will turn to Vancouver Fashion Finder to explore stores and events that match their style quickly and easily. The app helps them save time, discover new brands, and stay up to date with local sales and pop-ups.

Project Features

Feature 1: Style-Based Recommendations

- Users choose categories such as streetwear, vintage, high-end, outdoor, jewelry, or eco-friendly.
- The app suggests stores and brands that match those styles.

Feature 2: Map Integration

- Location-based map with filters for style, price range, and distance.
- Helps users find nearby shops or explore new neighborhoods.

Feature 3: Personalized Quiz

- A short quiz on preferences generates custom store recommendations.
- Makes discovery fun and interactive, also makes this app more personalized.

Feature 4 Events & Sales Updates

- Notifications about fashion markets, sample sales, and pop-up shops.
- Data gathered from public APIs (Eventbrite, Meetup), RSS/ICS feeds from local venues, merchant opt-ins, and community submissions.

Data Driven Component

- How will you use data?

Data will personalize store recommendations, display fashion events, and visualize store locations on maps.

- What dataset will you visualize?

- Store and style categories curated by the team
- Event and sales data from public APIs and opt-in merchants
- User inputs from quizzes and community reviews

- Can the data change via user interaction?

Yes. Users can adjust their style preferences, take quizzes again, submit events, or review stores. These inputs will update recommendations and event feeds.

- Where is it from?

Public APIs (Eventbrite, Meetup, Google Places), venue RSS/ICS feeds, opt-in merchant submissions, community input, and curated local store data.

- How will the user interact with the data visualizations?

Through interactive maps, store lists, event calendars, and personalized dashboards.

- Why is this relevant to the user?

It ensures users see results that match their interests and discover new shopping opportunities they would otherwise miss.

3

- What is the data source?

Mix of real data (API/feeds), curated input (local stores), and user-generated content.

Major Feature

- Why is this feature important to the user and application?

Staying informed about pop-ups, sample sales, and limited events is valuable for fashion lovers who don't want to miss unique opportunities.

- What problem is being solved?

Pop-ups and sales are hard to track because they are scattered across social media or word of mouth.

- How is it being solved?

By combining data from Eventbrite, Meetup, venue RSS/ICS feeds, and opt-in merchant submissions, plus community suggestions, into one accessible feed.

- In what way will the user interact with this feature?

Users browse an event calendar or map, filter by category or date, and receive push notifications for upcoming events.

- Why is this relevant to the user?

It saves time, reduces frustration, and makes the app more engaging by keeping users updated with fresh, local content.

Feature 1: Style-Based Recommendations

- Helps users quickly find stores that fit their personal style.
- Solves the problem of scattered store information by organizing shops into clear categories.
- Relevant because users can discover new stores without endless searching.

Feature 2: Map Integration

- Important because it makes discovery location-driven and practical.
- Solves the problem of not knowing where stores or markets are located.

- Relevant because users can easily plan visits or explore new areas.

Feature 3: Personalized Quiz

- Important because it adds personalization and fun.
- Solves the problem of users not knowing where to start.
- Relevant because it creates a custom experience and builds engagement.
